

With all these new [features](#) where do we even start...

Here are couple highlights and you'll just have to check out the rest by [Requesting a License](#) and [Downloading](#) the 2.5 version for yourself.

- Expect to be spoiled by the new [Intelli-prompt](#) support as LextEdit practically builds the code and SQL statements for you.
- Not only does the [TraceProfiler](#) have added support for all log types and profile generation. It can download them at over **12x** the speed of those other tools, and generate profiles **7x** times faster too. That means you'll be working with the complete file over **15x** quicker, not to mention that the trace is immediately available while that pesky profile is created.
- Tired of supporting long running operations that require babysitting because of commit context or execution duration. Just setup the [AutoExecute](#) feature and move onto another task (or your lunch).
- Take control over your display through complete Style Editing with LextEdit and Profile Display Rules in the TraceProfiler

Enjoy the new product... and fill out a [Testimonial](#) with the extra time you'll save.
